

IN THE CLAIMS:

1. (Currently Amended) A vessel filter comprising a first filtering portion and a first anchoring portion spaced axially from the first filtering portion, a transverse dimension of the first filtering portion in an expanded configuration being less than a transverse dimension of the first anchoring portion in an expanded configuration, an end portion of the first anchoring portion spaced from the first filtering portion converging to a first converging section, and a second filtering portion and a second anchoring portion spaced axially from the second filtering portion, a transverse dimension of the second filtering portion being less than a transverse dimension of the second anchoring portion, an end portion of the second anchoring portion spaced from the first filtering portion converging to a second converging section, each of the first and second filtering portions having segments each forming at least one loop, and each of the first and second anchoring portions having segments each forming at least one loop, the first and second filtering portions being positioned closer to each other in an axial direction than the first and second anchoring portions and being configured to allow continuous blood flow therethrough while capturing clots, and the anchoring portions being formed on first and second opposite portions of the vessel filter with the first and second converging sections being adjacent opposing end portions of the filter, the anchoring portions extending integrally from the respective filtering portions and extending axially along at least a portion of the length of the filter.
2. (original) The vessel filter of claim 1, further comprising a sleeve positioned between the first and second filtering portions.
3. (original) The vessel filter of claim 2, wherein the filtering portions and the anchoring portions are formed by three wires.
4. (original) The vessel filter of claim 1, further comprising a first anchoring member extending from the first anchoring portion and a second anchoring member extending from the second anchoring portion.

5. (original) The vessel filter of claim 4, wherein the filtering and anchoring portions are formed by three wires, the first and second anchoring members each having a lumen to receive one of the three wires and each further having first and second opposing sharpened ends for engaging the vessel wall.
6. (original) The vessel filter of claim 5, wherein in a collapsed configuration of the vessel filter the three wires are in an elongated configuration, substantially parallel to a longitudinal axis of the filter.
7. (original) The vessel filter of claim 2, wherein the transverse dimensions of the first and second anchoring portions are substantially equal and the transverse dimensions of the first and second filtering portions are substantially equal.
8. (original) The vessel filter of claim 7, wherein the each of the filtering portions progressively increases in diameter towards its respective anchoring portion.
9. (Amended) A surgical apparatus comprising a vessel filter having a first portion, a second portion and an intermediate portion between the first and second portions, the first portion increasing in diameter from the intermediate portion towards a first end, and the second portion increasing in diameter from the intermediate portion towards a second end, a region closer axially to the intermediate portion forming a filter portion, ~~and~~ a first region further axially from the intermediate portion forming ~~an~~ a first anchoring portion and a second region further axially from the intermediate portion forming a second anchoring portion to retain the filter within the vessel, and the filter being configured to allow continuous blood flow therethrough while capturing clots, the anchoring portion dimensioned to contact the vessel wall and spaced radially from a central axis of the apparatus, wherein ~~elements~~ regions of the first and second anchoring portion extend radially distally in a first direction and bend back to extend proximally in a second direction.
10. (original) The apparatus of claim 9, wherein the filter is formed by at least one wire, each wire forming a part of the first, second and intermediate portions.

11. (original) The apparatus of claim 10, further comprising a retaining sleeve at the intermediate portion to retain the at least one wire.
12. (original) The apparatus of claim 11, further comprising a tubular anchoring member extending from the first and second portions and having opposing sharpened ends to engage the vessel wall.
13. (original) The apparatus of claim 9, wherein the filter is composed of shape memory metal.
14. (canceled) A method of implanting a vein filter in the inferior vena cava of a patient comprising:
 - inserting through a femoral vein, superior vena cava or an internal jugular vein a catheter having a filter positioned therein in a collapsed configuration so that a first, second and third wire of the filter are in a substantially elongated configuration;
 - delivering cold saline into the catheter to maintain the filter in the collapsed configuration;
 - releasing the filter from the catheter to enable the filter to move to an expanded configuration in response to warming by exposure to body temperature, in the expanded configuration a pair of mounting portions expand to a first diameter and a pair of filter portions expand to a second smaller diameter.
15. (canceled) The method of claim 14, further comprising the step of opening a valve to enable infusion of cold saline into the catheter.
16. (canceled) The method of claim 14, wherein the step of releasing the filter initially ejects a first of the pair of mounting portions and a first of the pair of filter portions.
17. (canceled) The method of claim 14, wherein the step of releasing the filter comprises withdrawing the catheter to expose the filter.
18. (canceled) The method of claim 16, wherein the step of releasing the filter comprises withdrawing the catheter to expose the filter.

19. (previously presented) The apparatus of claim 9, wherein the filter further comprises a plurality of anchoring members spaced from a proximalmost and distalmost end of the filter.
20. (previously presented) The apparatus of claim 1, wherein the first and second filtering portions converge and are retained by a sleeve.
21. (previously presented) The apparatus of claim 1, wherein the filter comprises a retaining sleeve at the first converging section and a retaining sleeve at the second converging section.
22. (previously presented) The apparatus of claim 4, wherein the anchoring members have opposing sharpened ends.
23. (previously presented) The apparatus of claim 9, wherein the anchoring portion converges at a first end to form a first converging section and at a second end to form a second converging section.
24. (previously presented) The apparatus of claim 23, further comprising a retention member at the first converging section and a retention member at the second converging section.
25. (previously presented) The apparatus of claim 23, further comprising a retention member for retaining a converging region of the filter portion.
26. (previously presented) A surgical apparatus comprising a vessel filter having a first portion, a second portion and an intermediate portion between the first and second portions, the first portion increasing in diameter from the intermediate portion towards a first end, and the second portion increasing in diameter from the intermediate portion towards a second end, a region closer to the intermediate portion forming a filter portion, and an a looped anchoring portion formed at the first end and second end and extending in an axial direction from the filter portion, an end region of each anchoring region which is spaced further axially from the filter portion converging to form a converging section spaced from the filter portion.

27. (previously presented) The apparatus of claim 26, further comprising a connecting element at each converging section.
28. (previously presented) The apparatus of claim 8, wherein the filtering portion progressively increases in a direction away from a center of the filter, the anchoring portions being on opposing sides of the filter with the filtering portion therebetween.
29. (previously presented) The apparatus of claim 26, wherein an end region of each anchoring region converges toward a central longitudinal axis of the apparatus to form a converging region spaced from the filter portion.
30. (new) The apparatus of claim 1, wherein regions of the anchoring portions curve inwardly toward the longitudinal axis to form a curve devoid of free ends.
31. (new) The apparatus of claim 9, wherein the elements of the first and second anchoring portions bend back to form a closed loop configuration.
32. (new) The apparatus of claim 29, wherein the first and second anchoring portions and the first and second filtering portions comprise multiple loops.
33. (new) The surgical apparatus of claim 26, wherein an end region of each anchoring region converges toward a central longitudinal axis of the apparatus to form a converging section spaced from the filter portion.
34. (new) The apparatus of claim 26, wherein the anchoring portions comprises multiple closed loops.
